CAR RENTAL MANAGEMENT SYSTEM

One web platform where customers rent cars online and employees run the whole rental business from a single screen, with no paper or spreadsheets.

INTENDED USE | OVERALL FUNCTIONALITY | TEAM OF 7 | WEB-BASED

Who will use it, and how

Many small rental businesses still run on phone calls, paper forms and one shared spreadsheet. Cars get double booked and nobody is sure which car is back. Our system replaces that with one web application used every day by two groups: the customers who rent the cars and the employees who look after them.

Customers

Anyone who needs a car for a few days: students, families, tourists and business travelers with a driving license.

HOW THEY USE IT

- Create an account once, with contact details and driving license.
- Browse the fleet and filter by type, price, seats and fuel.
- Choose pick-up and return dates and see straight away which cars are free.
- Send a rental request, follow its status, or cancel it if plans change.
- See their profile and every earlier rental from their own account.

> *Sara needs a car for the weekend. She picks Friday to Monday, sees the Corolla is free and sends a request in a minute, with no phone call.*

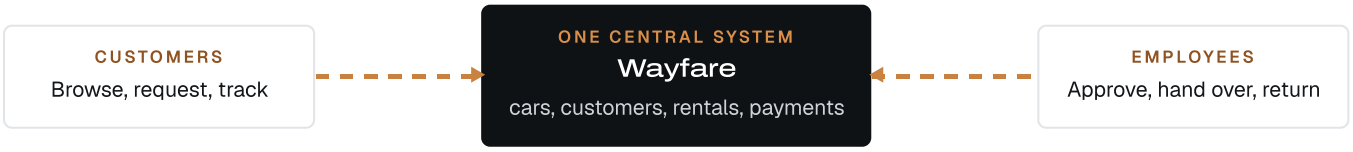

Employees

Branch staff and the manager, who approve requests, hand over keys and keep the fleet in order in a separate staff console.

HOW THEY USE IT

- Add, edit and remove cars, and mark a car as under maintenance.
- Review incoming requests, then approve or reject them.
- Check the customer's license and hand over the keys.
- Record each return, so the car can be booked again straight away.
- See every customer and every payment in one list.

> *Nadia opens the staff console each morning: three requests wait and two cars are due back. She approves what she can, and each car she checks in is bookable again at once.*

Both sides work on the same data. A request sent at nine is on an employee's screen at nine, and nobody has to call anybody to find out what is going on.

OVERALL FUNCTIONALITY

What the system does, and how it helps

Wayfare covers the whole life of a rental, from the first search to the day the car comes back. It is built from eight connected parts, and each one removes a task that is slow or error-prone when done by hand.

Customer management

Registration and login with contact details and driving license. Customers see their profile; staff see every customer.

Car management

Staff add, edit and delete cars, with model, category, daily rate and status (available, rented, maintenance).

Car availability

Customers list the cars that are free for their dates. Staff see every car and its status.

Rental booking

A customer requests an available car for a specific period, and can cancel the request.

Rental management

Staff approve or reject each request and hand over the keys. Dates and status are tracked.

Vehicle returns

Returned cars are recorded and become available again straight away.

Rental history

Customers see their own rentals. Staff see every rental with its customer and car.

Payments

Staff see every payment and its status. A rejected request follows the agreed refund rules.

How one rental flows

Each step has a status the customer and the staff can both see.

Browse
Pick dates, filter cars

Request
Customer sends a booking

Approve
Staff accept or reject

Pick up
License checked, keys out

Return
Car checked in

History
Saved for both sides

For customers

- **No waiting on the phone.** They see availability and prices themselves, any time.
- **A clear price up front.** Daily rate times days, shown before they send anything.
- **Everything in one place.** Requests, upcoming trips and past rentals.

For employees

- **No double bookings.** A car cannot be booked for dates that are already taken.
- **One screen, not three notebooks.** Requests, cars, returns and payments together.
- **Proof when it matters.** A full history settles questions about dates and payments.

For the business

- **A live picture of the fleet.** Which cars are out, free or in the workshop.
- **Every list in one place.** Cars, customers, rentals and payments, without a spreadsheet.
- **Less admin per rental,** so the same team can serve more customers.

Where we are. Sprints 1 and 2 are done: a clickable front end for every screen (7 customer and 7 staff pages), the ERD, models, endpoint list, DbContext and database. Sprints 3 to 7 build the API, Sprint 8 tests it all by 25 December, and our project management plan shows who does what.
